The graph of a function f is the graph of the equation $y = f(x)$.
A function is called **continuous** if its graph has no breaks or holes.

Definition

A function is a special type of relation. A **FUNCTION** is a correspondence between a first set, called the *domain*, and a second set, called the *range*, such that each member of the domain corresponds to *exactly one* member of the range.

However, different elements of the domain are allowed to have a correspondence with the same value in the range.

Figure : F is a FUNCTION (left), R is a relation but NOT A FUNCTION (center) & an example of a function (right) whose two different domain elements are associated with the same range element.

Theorem (VERTICAL LINE TEST (VLT))

A curve in the coordinate plane is the graph of a function if and only if there is no vertical line that crosses the graph more than once.

Does the equation $x^2 + y^2 = 16$ define y as a function of x ?

$p(x) = x^n$ is called a **power function**.

 If n is even, the graph of $f(x) = x^n$ is similar to the parabola $y = x^2$.

 If n is odd, the graph of $f(x) = x^n$ is similar to the cubic $y = x^3$.
